Excerpt: . located below the separator for the liquid to drain into. This tank should be provided with a water jacket, with steam connection to keep the water hot for the purpose of re-evaporating the liquid ammonia, the gas piped back to the suction side of the compressor. In this way the tank serves the double purpose of converting the liquid from the separator into a gas and purifying the ammonia by separating out the oil or water that may have been taken into the system by leaks or inferior ammonia and the oil that works into the system from the compressor. When the liquid from the separate-is carried back to the evaporating coils, there is practically no loss from this source, as the liquid is re-evaporated and will do useful work in the transfer of heat, but the beneficial results of leading the separator drain...
